My biggest concern is that the result is better than what exists now. This is definitely not a given with government projects. I hear discussion of engineered containment, would that be of the quality of the engineered tanks at Hanford? Engineered projects are never as perfect as the engineers that designed them think. I would rather hear about engineered neutralization of the contaminate. It won't be perfect, it will cost money, but there is an old adage about it costing too much to do it right the first time, that's why we need to do it again and again. It was disposed of once, in an approved manner, how did that work out? Will your plan be better, or just kicking the can down the road to get it off your desk and onto the future desk of someone else, brought to their attention by the poisoning of future children.

Also, where are you going to carry out your final disposal method? Please don't dump it in North Portland. I understand that the esteemed city council has drawn a red line around North Portland having determined that anything or anybody that nobody wants in their backyard can just be stuck there.

Thank you.
